SW3D2042H241-0x - Controller

Installation instructions

i Refer to installation use and maintenance manual for more information.

### 2 phase bipolar stepper drive technical data:

- DC power supply: 12 ÷ 48 Vdc
- DC logic supply: 12 ÷ 48 Vdc (optional and not isolated)
- Phase current: up to 6 Apeak
- Chopper frequency: ultrasonic 40KHz
- Stepless Control Technology (65536 position per turn)
- Protections against: over current, over/under voltage, overheating, short circuit between motor phase-to-phase and phase-to-ground
- EtherCAT communication interfaces
- Service SCI interface for programming and real time debugging
- 4 digital inputs (opto-coupled)
- 2 digital outputs (opto-coupled)
- Dimensions: 104.8 x 62.5 x 23.5 mm (without connectors)
- Protection degree: IP20
- Pollution degree: 2
- Category C3 following standard EN 61800-3
- Working temperature 5°C ÷ 40°C; Storage temperature -25°C ÷ 55°C
- Humidity: 5% ÷ 85% not condensing

19	●●●●●●●●	Red ON (1sec) + Yellow 7 Blink	eePLC User Protection (generated by setting bit #0 of eePLC_User_Settings)

⚠️ *NOTE: Drive could be considered in a correct status if leds Red, Yellow and Blue are all OFF.*
In general:
  • Led Blue indicates a software internal fault or a non-operative condition
  • Led Red indicates an alarm or a drive protection
  • Led Yellow indicates a warning

R1 (MSD): Most Significant Digit that must by multiplied per 16.
R2 (LSD): Least Significant Digit that must by multiplied per 1.
Example: 5C
        R1 = 5 ----> 5x16 = 80
        R2 = C ---> 12x1 = 12
        EtherCAT ID = 92

ℹ️ If not using the STO feature, the interface must be connected to an external +24Vdc supply in order enabled the drive (see above pictures).

Verify the installation

- Check all connection: power supply and inputs/outputs.
- Make sure all settings right for the application.
- Make sure the power supply is suitable for the drive.
- If possible, remove the load from the motor shaft to avoid that wrong movements cause damage.
- Enable the current to the motor and verify the applied torque.
- Enable a movement of some steps and verify if the rotation direction is the desired one.
- Disconnect the power supply, connect the load on the motor and check the full functionality.

Analysis of malfunctions

⚡ **When any of the following situations occur, the drive is placed in a fault condition.**

DEFECT	CAUSE	ACTION
Intervention of the themal protection.	Can be caused by a heavy working cycle or a high current in the motor.	Improve the drive cooling by a natural or fan air flow. Consider to use a motor with a higher torque vs current rating.
Intervention of the current protection.	Short circuit on the motor powering stage(s) of the drive.	Check motor windings and cables to remove the short circuits replacing faulty cables or motor if necessary.
Intervention of the over/under voltage protection	Supply voltage out of range.	Check the value for the supply voltage.
Open phase motor protection.	Motor windings to drive not proper connection.	Check motor cables and connections to the drive.

⚡ **When any of the following situations occur, the drive doesn't work and isn't placed in an error condition.**

DEFECT	CAUSE	ACTION
Noisy motor movement with vibrations.	Can be caused by a lack of power supply to a phase of the motor or a poor regulation of the winding currents.	Check the cables and connections of the motor and/or change the motor speed to avoid a resonance region.
The external fuse on the power supply of the drive is burned.	Can be caused by a wrong connection of the power supply.	Connect the power supply correctly and replace the fuse.
At high speed, the motor torque is not enough.	Can be due to a 'self-limitation' of motor current and torque.	Increase the motor current (always within the limits), increase the supply voltage, change motor connection from series to parallel.
