Service SCI connection

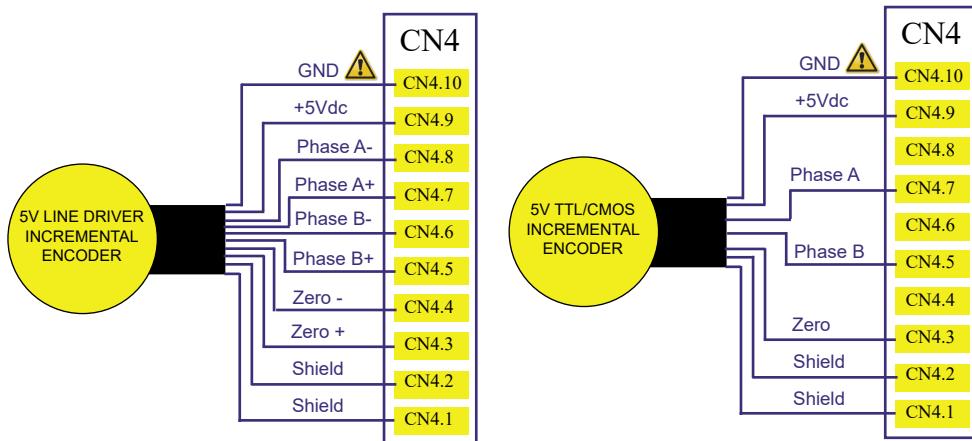

This connection is **only** possible with hardware and software provided by Ever.
Kit code: SW5_SERV00-SL or SW5-SERV00-EE.

Encoder input connection

Electrically NOT-isolated digital inputs:

- differential 5Vdc that meet the RS422 standard
- single-ended 5Vdc TTL/CMOS

Maximum supply current 100mA.

GND is internally in common with power ground, this is potentially dangerous.
Take all necessary measures to avoid possible contacts in the final installation.

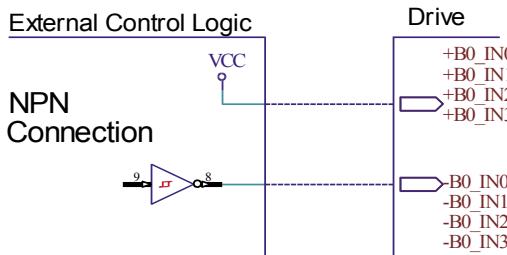

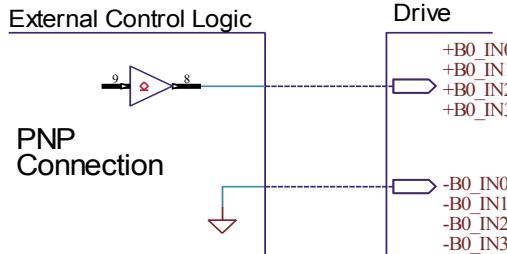

Digital inputs connection B0

B0_IN0 to B0_IN3 and B0_IN8 to B0_IN11

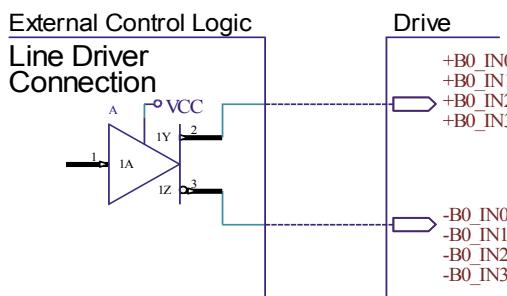

Differential PNP, NPN and Line Driver type.

3.3 - 24V INPUT

2 - 24V INPUT

**Standard Digital Inputs
(B0_IN0, B0_IN1 and B0_IN8 to B0_IN11)**

Characteristics	MIN.	MAX.	Unit
Supply voltage	2 ⁽¹⁾	24	Vdc
Inputs frequency	--	10	kHz
Threshold switching voltage	1.61 ⁽¹⁾	--	Vdc
Current at 2 Vdc	--	2.53	mA
Current at 3.3 Vdc	--	5.84	mA
Current at 5 Vdc	--	6.28	mA
Current at 24 Vdc	--	8.75	mA

**High-Speed Digital Inputs
(B0_IN2 and B0_IN3)**

Characteristics	MIN.	MAX.	Unit

Current at 3.3 Vdc	--	5.84	mA
Current at 5 Vdc	--	6.28	mA
Current at 24 Vdc	--	8.75	mA

(1) N.B.: it's recommended to use 2Vdc digital inputs only in differential Line-Driver configuration to have more noise immunity.

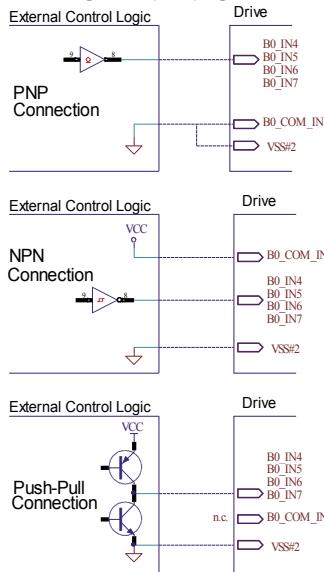

Digital inputs connection B1

B1_IN0 to B1_IN7

Single-Ended PNP, NPN, Push-Pull.

5 - 24V INPUT

Low-Speed Digital Inputs (B1_IN0 to B1_IN7)			
Characteristics	MIN.	MAX.	Unit
Supply voltage	5	24	Vdc
Inputs frequency	--	250	Hz
Threshold switching voltage	2.5	--	Vdc
Current at 5 Vdc	--	2	mA
Current at 24 Vdc	--	12	mA

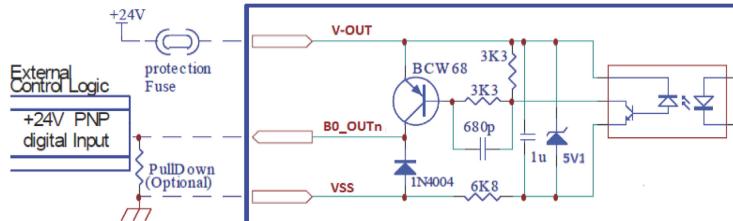

N.B.: All these inputs must be connected with the same configuration (PNP, NPN or Push-Pull).

Digital outputs connection B0

B0_OUT0, B0_OUT1 and B0_OUT3

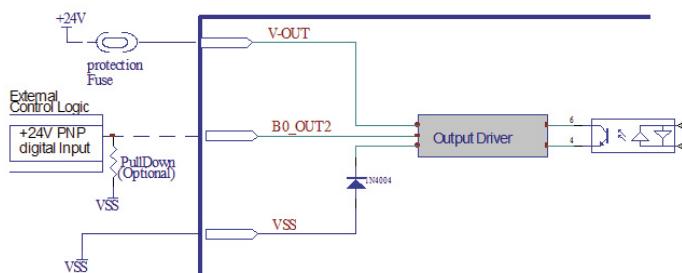

PNP with VOUTmax=24Vdc, IOUTmax=100mA, Fmax = 250kHz

B0_OUT2

PNP with VOUTmax=24Vdc, IOUTmax=1.3A, Fmax = 1kHz

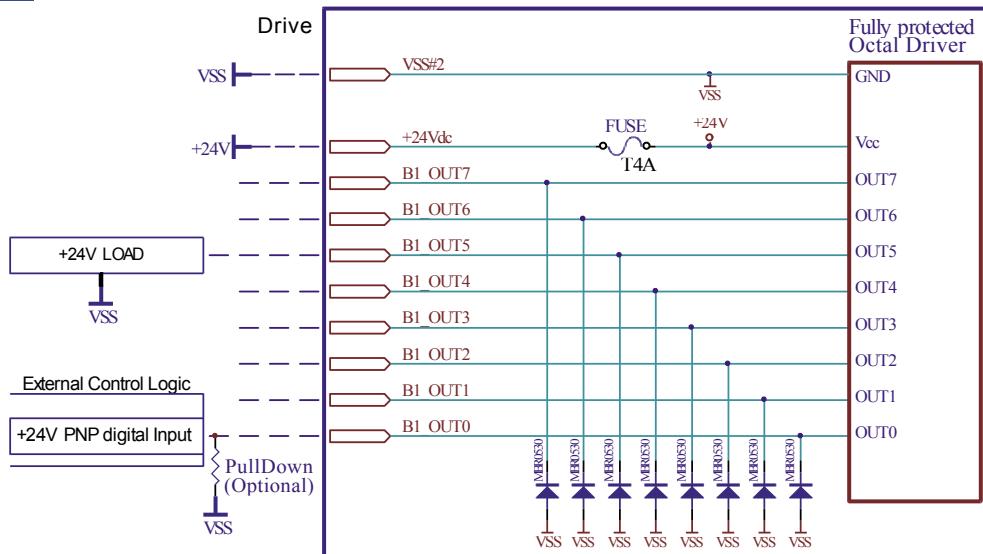

Digital outputs connection B1

B1_OUT0 and B1_OUT7

PNP with VOUTmax = 24Vdc, IOUTmax = 100mA, Fmax = 250Hz

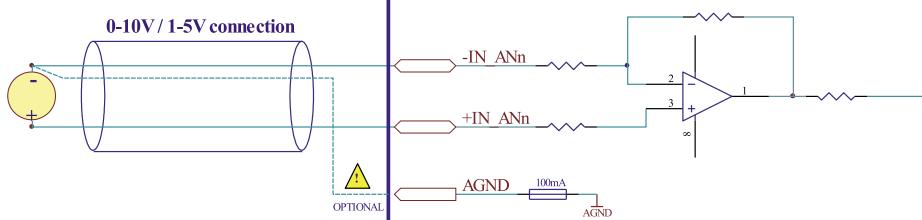

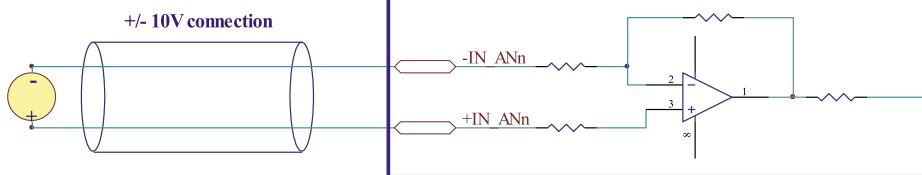

Analog inputs connection

The resolution of the analog inputs depends from the type of the connection which could be defined by software: differential or potentiometer.

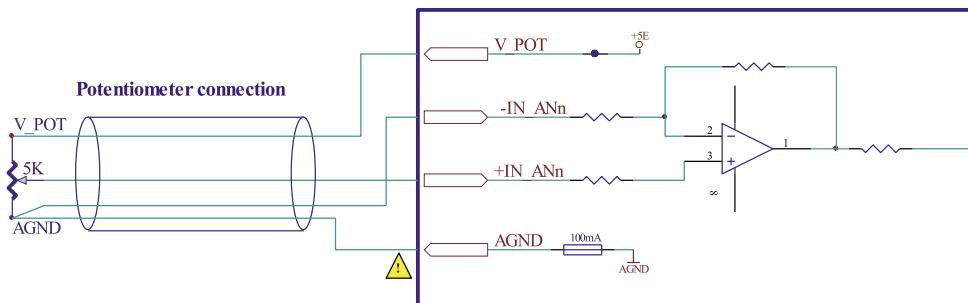

DIFFERENTIAL CONNECTION

The connection from an external reference and AGND should be preceded by a thorough risk analysis on the machine/circuit in which the drive will be installed.

Analog inputs connection

POTENTIOMETER CONNECTION

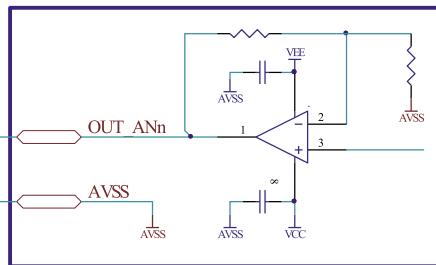

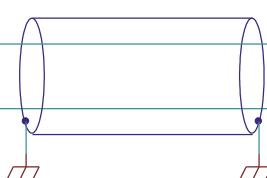

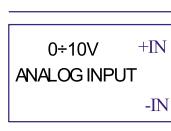

*AGND is internally in common with power ground, this is potentially dangerous.
Take all necessary measures to avoid possible contacts in the final installation.*

Analog outputs connection

0-10V isolated analog outputs

Verify the installation

- Check all connection: power supply and inputs/outputs.
- Make sure all settings right for the application.
- Make sure the power supply is suitable for the drive.
- If possible, remove the load from the motor shaft to avoid that wrong movements cause damage.
- Enable the current to the motor and verify the applied torque.
- Enable a movement of some steps and verify if the rotation direction is the desired one.
- Disconnect the power supply, connect the load on the motor and check the full functionality.

Drive's fault analysis

 When any of the following situations occur, the drive is placed in a fault condition.

DEFECT	CAUSE	ACTION
Intervention of the thermal protection.	Can be caused by a heavy working cycle or a high current in the motor.	Improve the drive cooling by natural or fan air flow. Consider to use a motor with a higher torque vs current rating.
Intervention of the current protection.	Short circuit on the motor powering stage(s) of the drive.	Check motor windings and cables to remove the short circuits replacing faulty cables or motor if necessary.
Intervention of the over/under voltage protection.	Supply voltage out of range	Check the value of the supply voltage
Open phase motor protection.	Motor windings to drive not proper connection.	Check motor cables and connections to the drive.

 When one of the following situations occur, the drive doesn't function correctly and it is reported an error.

DEFECT	CAUSE	ACTION
Noisy motor movement with vibrations.	Can be caused by a lack of power supply to a phase of the motor or a poor regulation of the winding currents.	Check the cables and connections of the motor and/or change the motor speed to avoid a resonance region.
The external fuse on the power supply of the drive is burned.	Can be caused by a wrong connection of the power supply.	Connect the power supply correctly and replace the fuse.
At high speed, the motor torque is not enough.	Can be due to a "self-limitation" of motor current and torque.	Increase the motor current (always within the limits), increase the supply voltage, change motor connection from series to parallel.
